PROJECTS

Project 1: News site using GNews API (link).

Description: Developed a news application utilizing the GNews API to fetch and display the latest news headlines and articles. The React-based frontend presents news cards featuring titles, descriptions, images, and publication dates, providing a visually appealing and user-friendly experience. Users can access detailed articles for a comprehensive view of current events.

Project 2: Optic Cup and Disc Segmentation.

Description: Implemented a deep learning-based project to segment the optic disc (OD) and optic cup (OC) from fundus images, aiming to detect glaucoma. Introduced a novel model, UE-Net, by combining the Standard U-Net with EfficientNetB3, to enhance performance while reducing computational costs. The UE-Net model demonstrated superior accuracy compared to the U-Net and a modified U-Net with VGG16, outperforming them in segmentation tasks.
